

Perimeter

Perimeter is the distance around an object, such as a yard or building. To determine the perimeter of these shapes, measure each side, add those measurements together, and write in the correct unit of measurement.

Example:

Because a rectangle contains two equal sides and two equal ends, to find this perimeter add $2\frac{1}{2}' + 2\frac{1}{2}' + 16\frac{1}{4}' + 16\frac{1}{4}'$ for a total of $37\frac{1}{2}'$. For some triangles and other less standard shapes, each side may be a different length.

Determine the perimeter of the following shapes and **put the answer inside each shape.** Make sure to include the unit of measurement in your answers.
